Laparoscopic and/or Robotic Surgery Postoperative Instructions

Care for your incisions:

1. The incision sites are typically sutured closed and covered with a liquid bandage. It is fine to shower after the first 24 hours. The sutures used to close the small incisions will dissolve in a few weeks.
2. It is normal to see some bruising around the sites. If the incision sites open up, it is ok to put a band aid over this site and it will usually close on its own in a few days. It is also ok to place triple antibiotic ointment over the site. If it appears red, or draining any fluid, call the office immediately.
3. Shoulder pain is common after laparoscopic or robotic surgery, as the air used to inflate your abdomen may cause some irritation to the diaphragm and cause this type of discomfort. Light ambulation/walking can help and this usually resolves within 24-48 hours.
4. It is possible to have a light vaginal drainage that may be pink, light red, or light brown. This is normal and may last up to 8 weeks. It should not be heavy like a period or passing large clots; if so, then call the office immediately.

Activities after surgery:

1. Walking and light housekeeping is allowed, but limit any lifting to no more than 10 pounds until your first follow up appointment.
2. Do not insert anything into the vagina - no tampons, no douching, no intercourse until you are fully cleared by your doctor- usually 8 weeks.
3. Driving is allowed once you no longer need the stronger narcotic pain medication, usually within 3-7 days.
4. Do not submerge in water- no bath tub, no pools, no hot tubs, no river/ocean water for the first 2 weeks. Shower only for the first 2 weeks and it is fine to shower any time after the first 24 hours.
5. Exercise is fine to resume once you no longer feel pains- usually after the first 7-10 days. Light activity, such as walking, is best at first and listen to your body. If you have discomfort, then stop the activity for a few days or until the pain resolves. You will likely have more pains near the belly button, as stronger stitches were placed here to avoid a hernia from developing. Do not over do the activity and avoid any direct stress or strain to your core muscles, such as planks, pushups, sit-ups until cleared by your doctor- usually 4-6 weeks.

Diet:

1. You may resume a regular diet. You may not have much of an appetite at first and this is normal. Eat what you feel like, but get plenty of fiber and fluids to help with avoiding constipation.
2. You may take a stool softener daily, such as Colase and Surfak, as these can help avoid constipation. These are available over the counter. Other options include Metamucil, Milk of Magnesia, and Magnesium Citrate.
3. Take a daily multivitamin as this can help with healing.
4. Drink at least 64 fluid ounces of water daily.

Pain Control:

1. Pain medications will be electronically sent to your pharmacy of choice prior to your discharge home from the hospital. These usually include Motrin (ibuprofen) and a stronger narcotic- Hydrocodone with Tylenol (Norco). If you are allergic to these medications, other will be sent. These are best taken in an alternating fashion. The Motrin is safely taken as 1 tablet every 6 hours as needed and the Norco can be 1-2 tablets every 4-6 hours as needed. It is best to take one of the Motrin and then start with one Norco 3-4 hours later and alternate this for the first 24-36 hours to keep your pain under good control once you go home from the hospital. If your pains are minimal, then only take the Motrin every 6 hours and save the stronger narcotic medication for evening time, as it does tend to cause drowsiness.
2. Do not drive while taking the stronger narcotic medication.
3. Pain medications are not refilled after hours or on weekends. Call the office during normal business hours if refills needed.

Go to the Emergency Room if you have any of the following:

- | | |
|-------------------------------|---|
| 1. Temperature over 100.4°F | 5. Persistent nausea/vomiting/diarrhea |
| 2. Heavy vaginal bleeding | 6. One sided leg pains and/or swelling |
| 3. Increasing abdominal pains | 7. Difficult urinating or pain with voiding |
| 4. Severe shortness of breath | |

Follow up appointments:

1. Your follow up appointment is usually scheduled for 3 weeks and 7-8 weeks after your surgery. It will be included with your discharge paperwork from the hospital. Call our office the following day if you leave the hospital without an appointment.

At Genesis Gynecology, I want you to have the best surgical experience and post-operative course possible, so please call our office anytime if you have questions or concerns.
